

Decision-support tools for biodiversity conservation: progress and challenges

Joe Bennett

Carleton University

Joseph.bennett@carleton.ca

Decision science for direct action

2 Archetypes:

Minimize cost subject to targets being met

Maximize benefit subject to cost constraint

Progress

1. Expansion from protected area allocation to more complex problems
2. Faster, more user-friendly tools
3. Increased integration with overall decision process

1. Expansion to more complex problems

Prioritizing among species, threats and actions

Integrating monitoring into optimization frameworks

2. Faster, more user-friendly tools

Progress from simpler heuristics to exact algorithms

Focus on user experience

Heuristic algorithms

Meta-heuristic algorithms

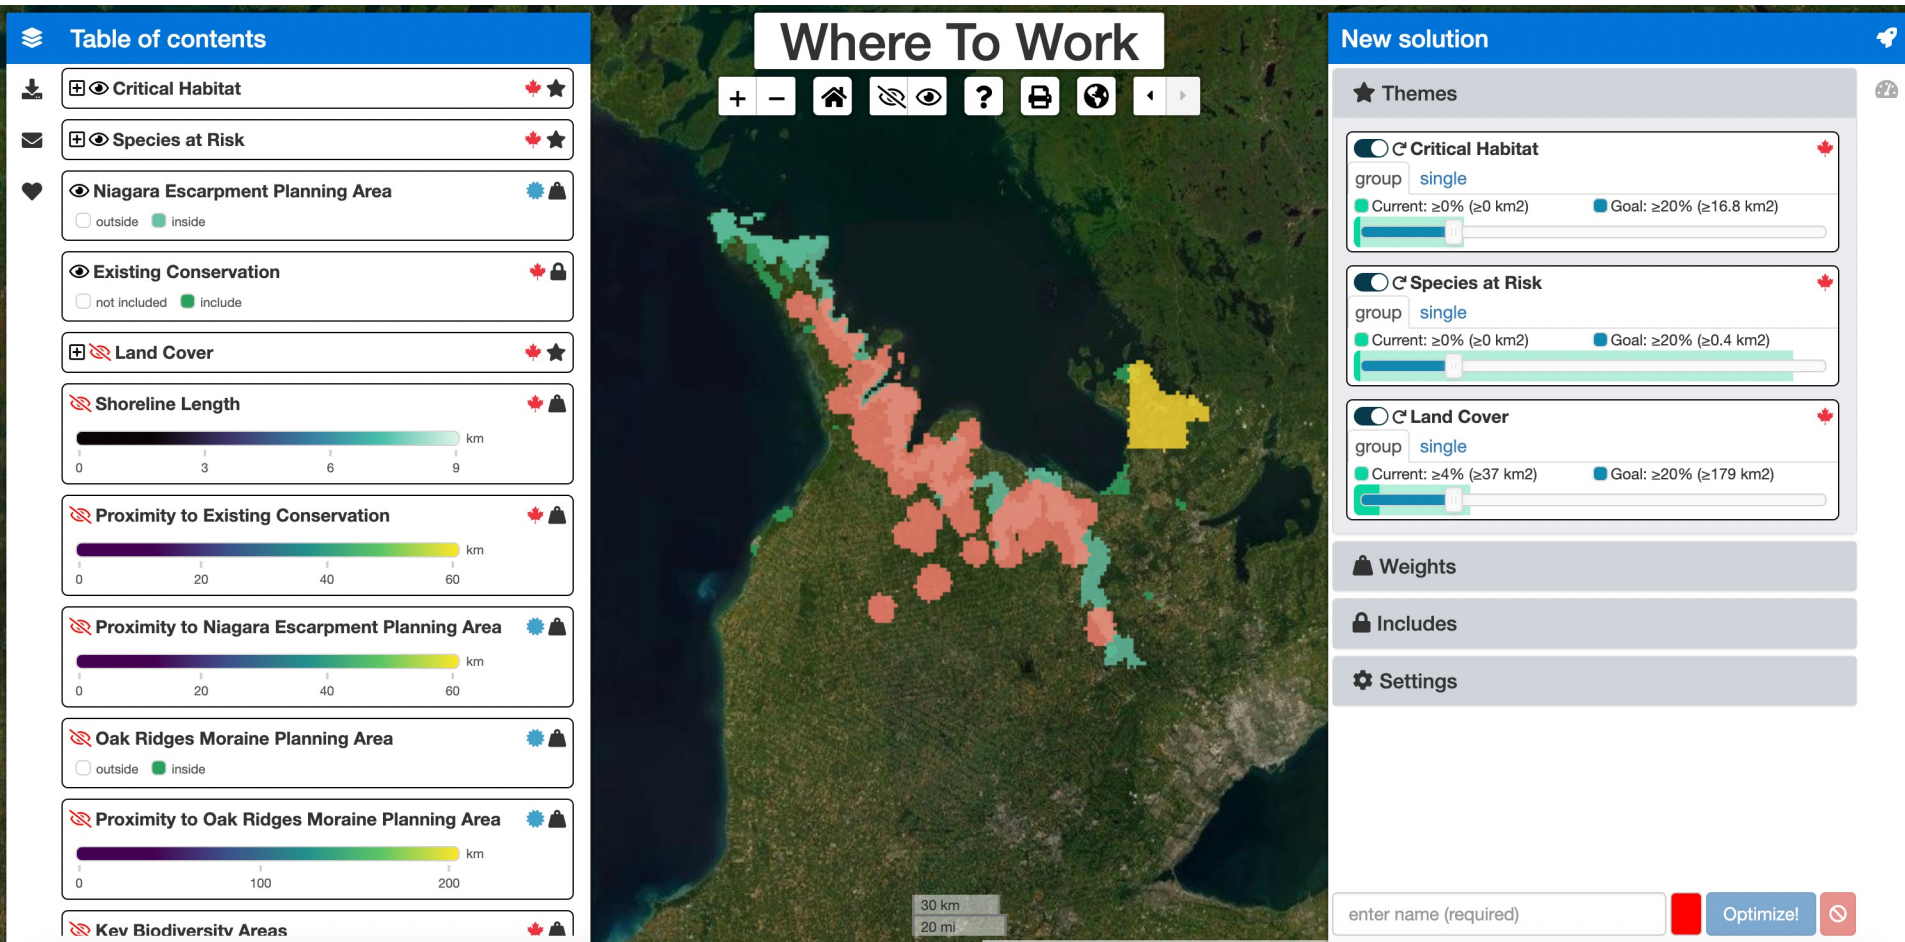

Exact algorithms

Estimate of best solution

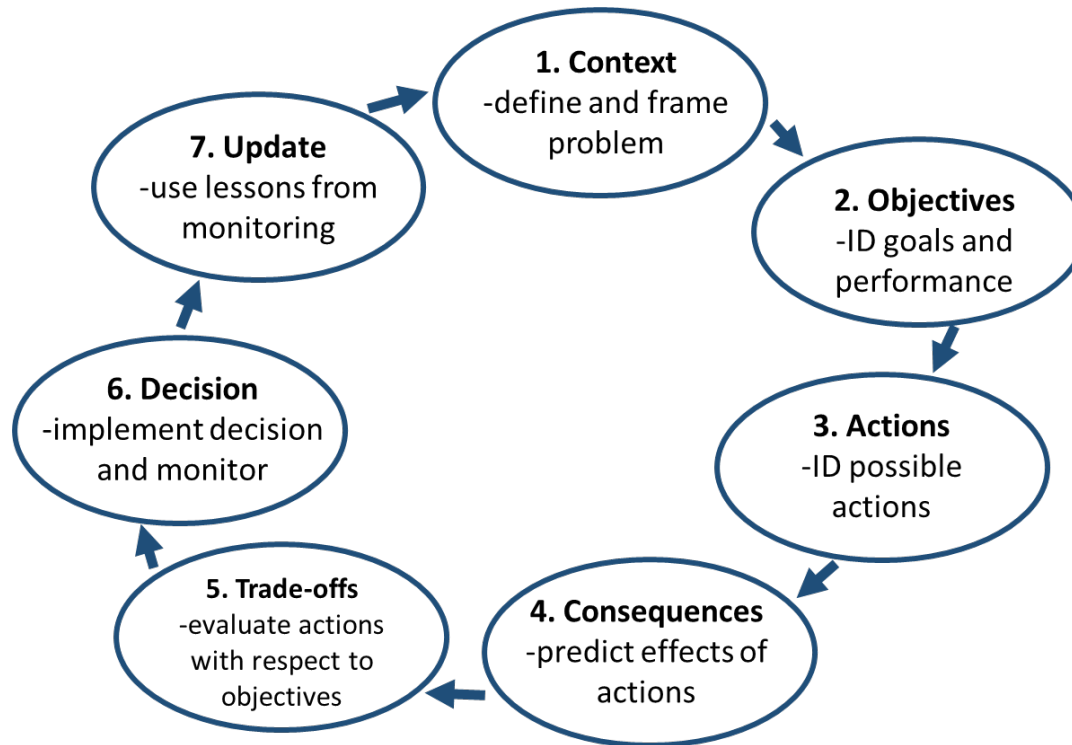

<https://ncc.carleton.ca/>

3. Increased integration with overall process

Structured and adaptive approaches that include values

Challenges

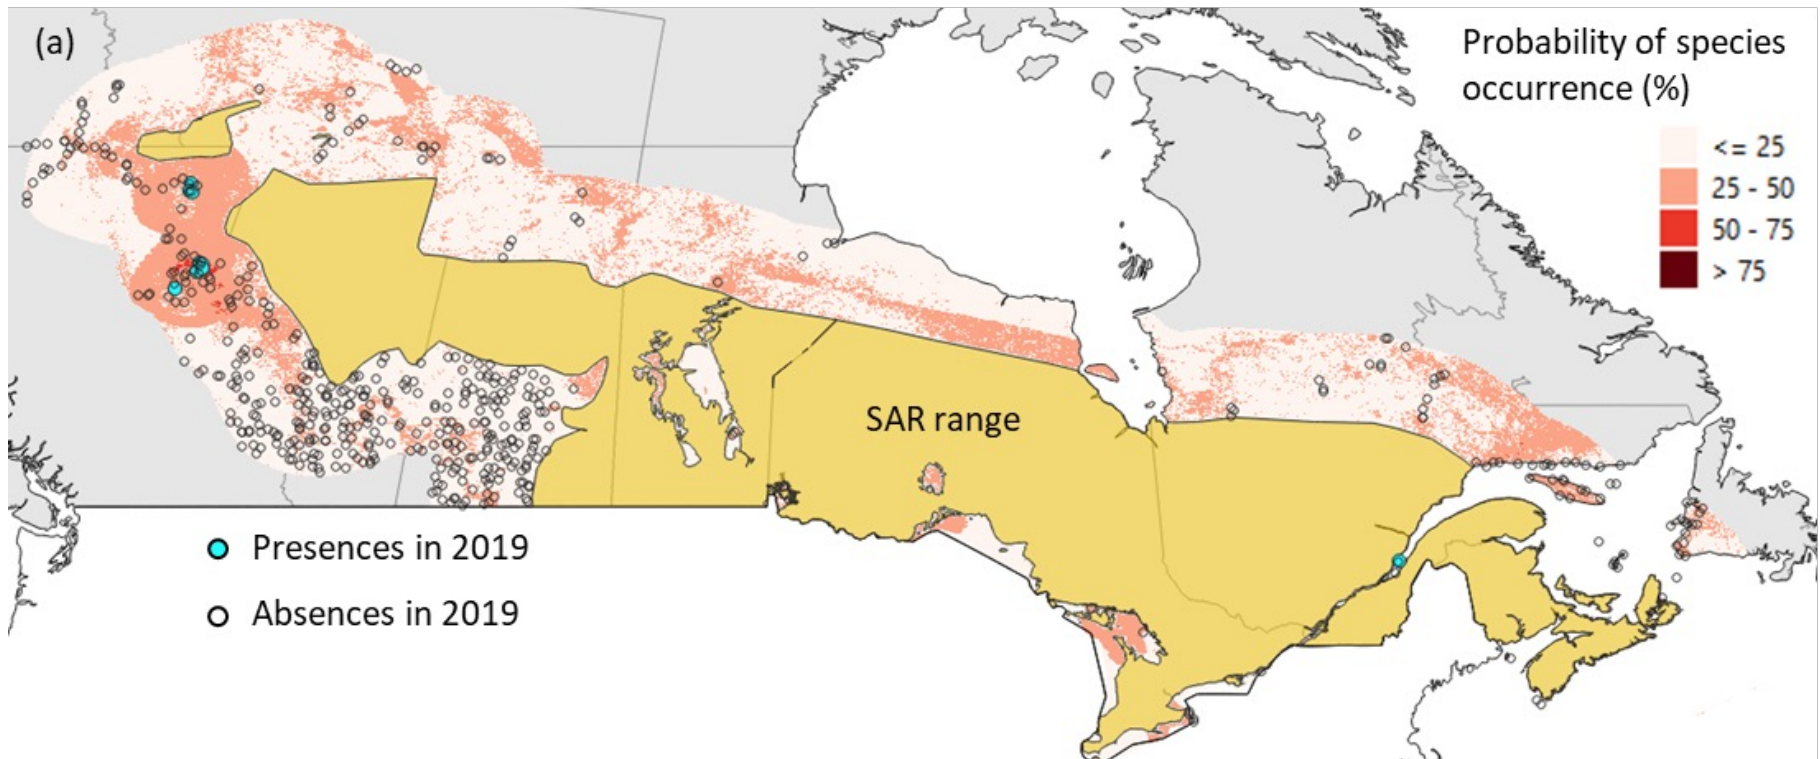

1. Information scarcity and shifting environments
2. Problem complexity vs open-source solvers
3. Information security and sovereignty
4. Aversion to using decision-support technology
5. Complex relationships among actors

Challenges

1. Information scarcity and shifting environments
2. Problem complexity vs open-source solvers
3. Information security and sovereignty
4. Aversion to using decision-support technology
5. Complex relationships among actors

3 partial solutions

1. Optimal monitoring techniques
2. Community science, Indigenous partnerships, remote sensing
3. Models that use information from multiple sources

Challenges

1. Information scarcity and shifting environments
- 2. Problem complexity vs open-source solvers**
3. Information security and sovereignty
4. Aversion to using decision-support technology
5. Complex relationships among actors

Challenges

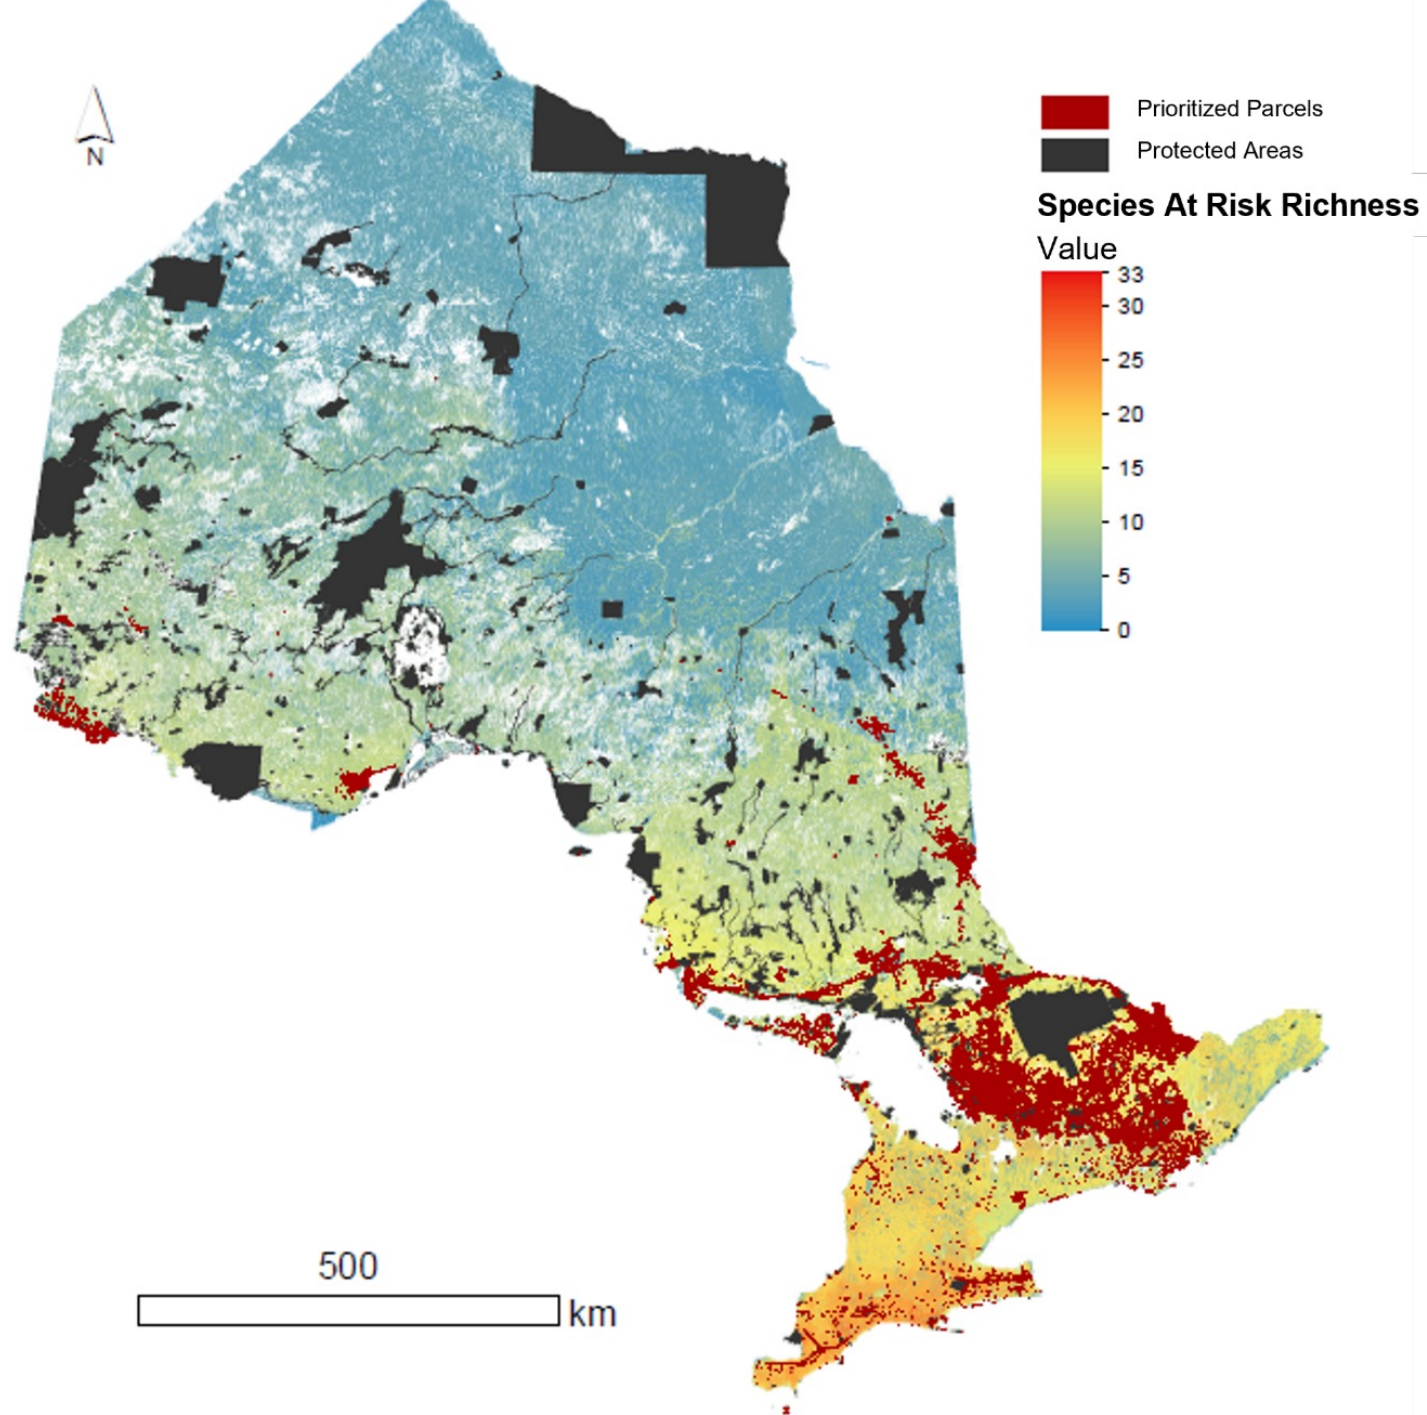

1. Information scarcity and shifting environments
2. Problem complexity vs open-source solvers
- 3. Information security and sovereignty**
4. Aversion to using decision-support technology
5. Complex relationships among actors

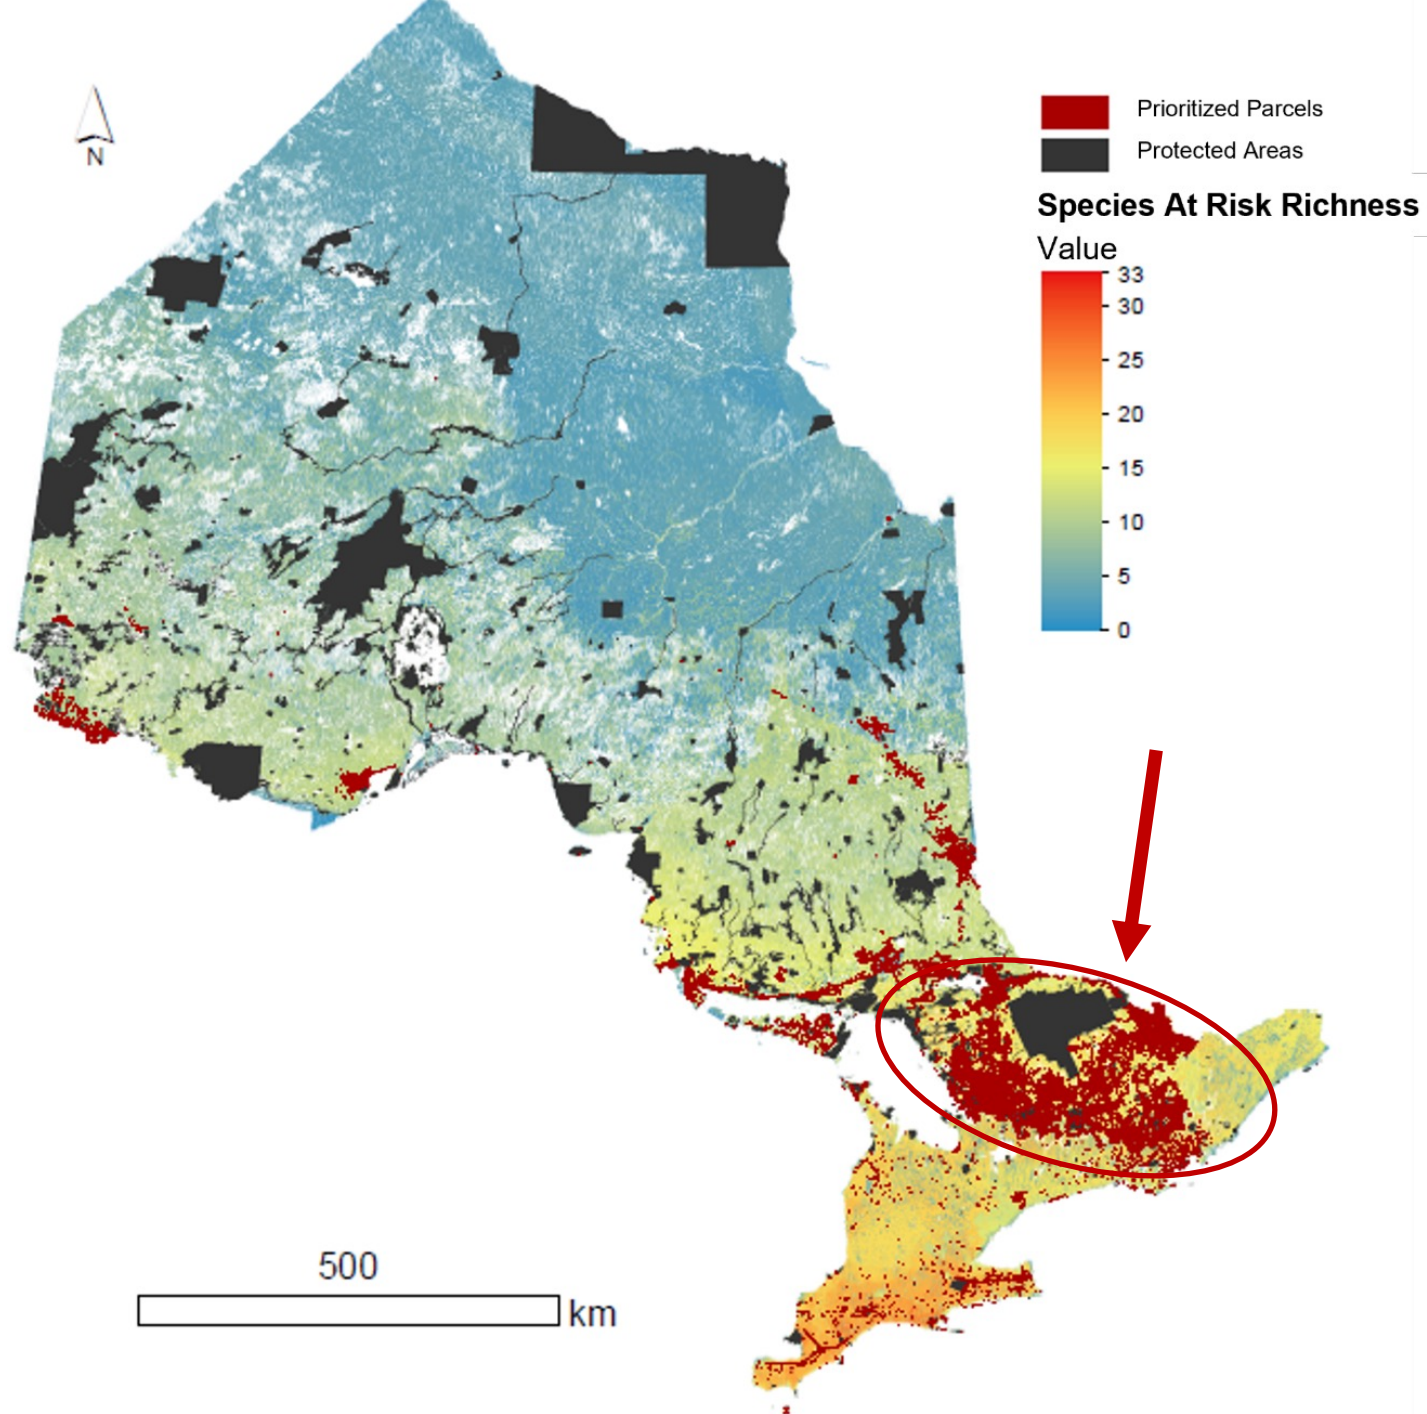

Challenges

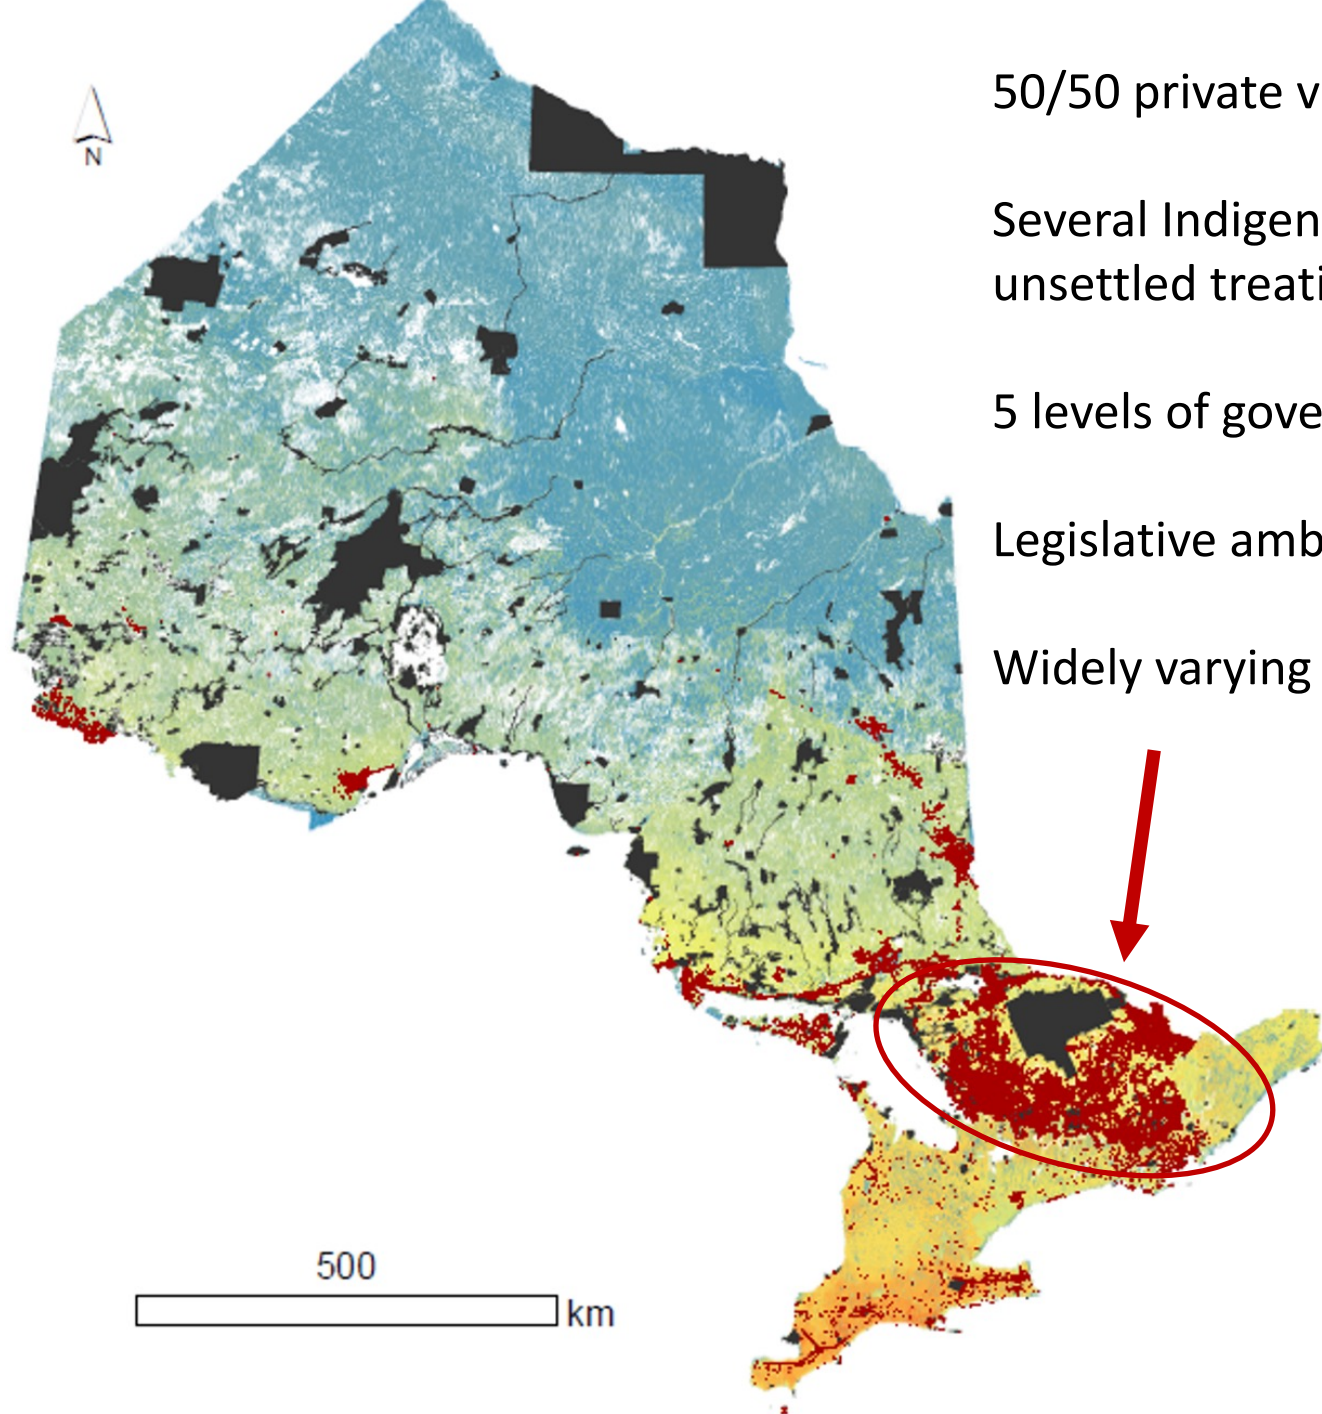

1. Information scarcity and shifting environments
2. Problem complexity vs open-source solvers
3. Information security and sovereignty
- 4. Aversion to using decision-support technology**
5. Complex relationships among actors

Challenges

1. Information scarcity and shifting environments
2. Problem complexity vs open-source solvers
3. Information security and sovereignty
4. Aversion to using decision-support technology
5. **Complex relationships among actors**

50/50 private vs public land

Several Indigenous Nations with
unsettled treaties

5 levels of government

Legislative ambiguity

Widely varying political opinions

Partial solutions

1. Direct partnerships with management agencies
2. Working with sociologists – living labs approach

Overall lessons

Human issues are likely more important than technical aspects

However, effective and usable technology can help in many ways
